

Introduction

Nova.Avalonia.AIKit is a UI toolkit for the interaction patterns around an AI system. It deliberately does not send model requests, store conversations, or require a specific provider SDK. Your application owns orchestration and state; AIKit renders that state and turns user actions into commands and routed events.

What the kit provides

- Conversation controls for prompts, messages, streaming output, citations, and follow-ups.
- Agent controls for progress, reasoning activity, tool calls, task status, and delegation graphs.
- Human-in-the-loop controls for approval, recommendations, feedback, and fine-tuning.
- Code and data controls for diffs, file changes, retrieved context, records, filters, and insights.
- Shared tokens, accessible light and dark resources, localization strings, and motion policy through [NovaTheme](#).

How state flows

Most controls accept ordinary values or [IEnumerableable](#) sources. Bind your view model to those properties, then handle a routed event or command when the user acts. This makes the controls suitable for MVVM as well as code-behind samples.

For example, a host can bind its transcript to [ChatMessageList.ItemsSource](#), append chunks to [StreamingTextBlock.StreamedText](#), and handle [PromptBar.Submitted](#) to start a model turn. AIKit remains independent of how the host obtains the response.

Platform and theme support

The package targets .NET 8 and Avalonia 12.1.1. Its themes layer on top of Avalonia Fluent or Simple, and the gallery demonstrates desktop, browser, Android, and iOS hosts. Motion-capable controls expose local animation switches and also respect the shared motion policy.

How to use these docs

Start with [Getting started](#), then choose a workflow from the [control guide](#). The [Nova.Avalonia.AIKit.Controls](#) API reference contains every property, event, enum, and data item.

Namespace Nova.Avalonia.AlKit

Classes

[NovaTheme](#)

Includes the Nova AlKit control themes and design tokens in an application. Add an instance to

Application.Styles:

```
<Application.Styles>
  <FluentTheme />
  <nova:NovaTheme />
</Application.Styles>
```
